Dokumentvorlage, Version vom 16.12.2021

Dossier zur Nutzenbewertung gemäß § 35a SGB V

Avapritinib (AYVAKYT®)

Blueprint Medicines (Germany) GmbH als örtlicher Vertreter des Zulassungsinhabers Blueprint Medicines (Netherlands) B. V.

Modul 4 A – Anhang 4-G

Avapritinib (AYVAKYT®) ist zur Behandlung von erwachsenen Patienten mit indolenter systemischer Mastozytose (ISM) mit mittelschweren bis schweren Symptomen indiziert, bei denen mit einer symptomatischen Behandlung keine ausreichende Kontrolle erzielt werden kann

Medizinischer Nutzen und medizinischer Zusatznutzen, Patientengruppen mit therapeutisch bedeutsamem Zusatznutzen

Stand: 20.12.2023

Anhang 4-G: Weitere Analysen und graphische Verläufe zu den in Abschnitt 4.3.1.3.2 gezeigten Ergebnissen der Subgruppenanalysen

Seite

Table 35.2.1.2.2.2a
Summary of Change from Baseline in TSS of the ISM-SAF by Sex
Per-Protocol Population, Part 2 (Part 2 Baseline)

	Sex = Male		Sex = Female		
	Placebo (N=15)	Avapritinib 25 mg (N=35)	Placebo (N=52)	Avapritinib 25 mg (N=88)	Test of Interaction p-value [1]
Baseline					
n	15	35	52	88	
Mean (StdDev)	58.46 (21.326)	47.46 (16.648)	53.18 (17.912)	55.65 (17.236)	
Median	64.93	43.31	48.26	53.99	
Min, Max	31.1, 86.3	28.6, 102.7	28.9, 104.4	29.6, 98.4	

Abbreviations: TSS = Total Symptom Score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.
Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. CxD1 score is defined as the 14-day average of TSS prior to CxD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to CxD1 visit, the CxD1 score is considered as missing for the patient. Patients with high-dose steroid use within 7 days before CxD1, or greater than 14 consecutive days at any point from C1D1 to C7D1, the CxD1 score will be set to missing and will be excluded from the ANCOVA analysis.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: TSS = Total Symptom Score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.
Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. CxD1 score is defined as the 14-day average of TSS prior to CxD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to CxD1 visit, the CxD1 score is considered as missing for the patient. Patients with high-dose steroid use within 7 days before CxD1, or greater than 14 consecutive days at any point from C1D1 to C7D1, the CxD1 score will be set to missing and will be excluded from the ANCOVA analysis.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score 14 day prior to CxD1 visit, the CxD1 score is considered as missing for the patient. Patients with high-dose steroid use within 7 days before CxD1, or greater than 14 consecutive days at any point from C1D1 to C7D1, the CxD1 score will be set to missing and will be excluded from the ANCOVA analysis.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Change from Baseline in Domain Scores and Neurocognitive Symptom Cluster of the ISM-SAF by Sex
Per-Protocol Population, Part 2 (Part 2 Baseline)

Gastrointestinal Domain Score

	Sex = Male		Sex = Female		
	Placebo (N=15)	Avapritinib 25 mg (N=35)	Placebo (N=52)	Avapritinib 25 mg (N=88)	Test of Interaction p-value [1]
Baseline					
n	15	35	52	88	
Mean (StdDev)	12.43 (7.316)	10.31 (5.462)	10.45 (6.579)	10.48 (6.293)	
Median	12.07	9.69	9.85	9.14	
Min, Max	0.0, 23.8	2.7, 26.8	0.1, 28.0	0.1, 26.3	

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

By Country subgroup analysis is not performed due to several countries have less than 10 patients.

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

	Placebo (N=27)	Avapritinib 25 mg (N=44)	Test of Interaction p-value [1]

By Country subgroup analysis is not performed due to several countries have less than 10 patients.

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

					0.075

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Difference (95% CI) in CFB [2]		1.00 (-0.33, 2.32)		-0.54 (-1.11, 0.02)	
p-value [3]		0.136		0.059	

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Difference (95% CI) in CFB [2]		-1.22 (-5.97, 3.53)		-0.76 (-1.35, -0.17)	
p-value [3]		0.563		0.012	

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Difference (95% CI) in CFB [2]		-1.59 (-4.39, 1.22)		-3.62 (-5.63, -1.60)	
p-value [3]		0.260		<0.001	

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.
Note1: The "lead domain/symptom cluster" score refers to the domain/symptom cluster with highest score at Baseline in each patient. If patient has tie with multiple lead domain/symptom clusters, the average of change from baseline is used for the summary.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
