Abbreviations: TSS = Total Symptom Score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval.
Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of TSS prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to C7D1 visit, the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.
Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: TSS = Total Symptom Score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval.
Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of TSS prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to C7D1 visit, the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.
Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: TSS = total symptom score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of TSS prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to C7D1 visit, the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: TSS = Total Symptom Score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval.
Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of TSS prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to C7D1 visit, the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.
Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of domain score prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating C7D1 score, then the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of domain score prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating C7D1 score, then the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Baseline refers to the last assessment value prior to C1D1 dosing in part 2 of the study.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Baseline refers to the last assessment value prior to C1D1 dosing in part 2 of the study.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Table 35.2.4.3.2a
Summary of KIT D816V Mutation Allele Fraction in Blood at C7D1
Per-Protocol Population, All Patients that reached C7D1 or EOS prior to C7D1 with detectable mutation at Baseline, Part 2 (Part 2 Baseline)

Patients with >= 50% Reductions in KIT D816V MAF or undetectable (<0.02%) for patients with detectable mutation at Baseline	Placebo (N=61) n/N (%) (95% CIs)	Avapritinib 25 mg (N=103) n/N (%) (95% CIs)	Odds Ratio (95% CIs) p-value [1]	Relative Risk (95% CIs) p-value [1]	Risk Difference (95% CIs) p-value [1]	Interaction [2]
Overall	4/ 61 (6.6) (1.8, 15.9)	70/103 (68.0) (58.0, 76.8)	41.06 (10.46, 146.26) <0.0001	11.42 (4.15, 31.43) <0.0001	0.62 (0.51, 0.73) <0.0001	
Age Group (Years)						0.950
< 65	4/ 50 (8.0) (2.2, 19.2)	64/ 97 (66.0) (55.7, 75.3)	28.55 (7.41, 103.23) <0.0001	8.55 (3.24, 22.54) <0.0001	0.58 (0.46, 0.70) <0.0001	
>= 65	0/ 11 (0.0) (0.0, 28.5)	6/ 6 (100.0) (54.1, 100.0)	NE (3.85, NE) <0.001	NE (NE, NE) NE	1.00 (1.00, 1.00) NE	
Sex						0.039
Male	3/ 14 (21.4) (4.7, 50.8)	20/ 30 (66.7) (47.2, 82.7)	5.67 (1.02, 34.83) 0.024	2.84 (0.98, 8.19) 0.053	0.39 (0.10, 0.68) 0.008	
Female	1/ 47 (2.1) (0.1, 11.3)	50/ 73 (68.5) (56.6, 78.9)	265.20 (17.98, 6038.36) <0.0001	41.65 (4.60, 377.08) <0.001	0.68 (0.57, 0.79) <0.0001	

Abbreviations: CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with detectable mutation at Baseline will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with detectable mutation at Baseline will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with aggregates at Baseline will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Patient reached C7D1 or EOS prior to C7D1 with missing C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
